Upcoming risk management workshops – free for Dental Protection members

The Dental Protection Risk Management Workshop Series is being offered in the coming weeks. All workshops are designed by experts, informed by [Dental Protection's](#) case experience, and aim to minimise risk and deliver improved patient care. Upcoming workshops include:

- Mastering Your Risk
- Mastering Adverse Outcomes
- Mastering Difficult Interactions

- Mastering Consent and Shared Decision Making

These three-hour workshops are provided **free of charge** to Dental Protection members and are Continuing Professional Development accredited. Non-members are also welcome to attend for a fee, and subject to availability. Singapore Dental Association members can attend for \$145 per person, per workshop.

More information about workshops in your area and instructions on how to register are available at dentalprotection.org/singapore. As many workshops book out quickly we recommend you register today.

Crown and Bridge GPS: Navigating the Maze of Indirect Dentistry Today

The world of indirect dentistry was relatively easy to understand for many years when choices were limited to gold and porcelain fused to metal restorations; however things have most definitely changed. The practitioner today must choose between numerous materials as well as workflow options. This course

will take a look at the advances in all aspects of crown and bridge dentistry ranging from provisional fabrication and post placement through CAD/CAM dentistry and the best practices of new age ceramics.

Speaker : Parag R. Kachalia (Associate Professor of Integrated Reconstructive Dental Sciences, University of the Pacific School of Dentistry)

Date: 2nd September 2016

Time: 0900hrs – 1230hrs (Lecture)

1400hrs – 1800hrs (Hands-on)

Venue: NUS Faculty of Dentistry, Level 3

SM 3A (Lecture)

Simulation lab (Hands-on)

Fees: \$40.00 (Lecture)

\$200.00 (Lecture and Hands-on)

CPE: 7 hours credit

Email: denaaa@nuhs.edu.sg

Enquiries: Ms Azlia Abdul Aziz

Closing Date: 29th August 2016

For any enquiry, please refer to the contact details as indicated.*

Introduction to Forensic Dentistry in Disaster Victim Identification

The Forensic Medicine Division, Health Sciences Authority (HSA), will be presenting an inaugural half day course on 25 Nov 2016 (Fri, 1.30 pm -

5.30pm) to introduce dentists and oral health therapists who are interested in learning about the role of dentistry in Disaster Victim Identification (DVI).

The course will introduce participants to an overview of forensic human identification during mass fatality incidents (i.e. Disaster Victim Identification), the scope and principles of forensic dental identification, and the role that dentists and oral health therapists can play during Disaster Victim Identification.

Participants will have a greater understanding of the value of the quality of their clinical records in the Disaster Victim Identification (DVI) process. Participants are also expected to become a “sleeper” forensic volunteer to assist Forensic Odontologists during times of mass fatality incidents within Singapore, a skill set that we hope you will never have to use.

It is envisioned that this introductory course will serve as a taster for the forensic volunteers to pursue further training (e.g. a more in-depth course that the HSA is exploring for the future).

[Please see attached course flyer for details and application form.](#) Interested applicants should complete the application form and return a copy to Amirah Mazlan at Amirah_Mazlan@hsa.gov.sg and Shirley Phua at Shirley_Phua@hsa.gov.sg

Effects of occupational noise exposure on hearing loss in dental professionals

If you have already done this survey before, please do not submit it again. We thank you for your participation

The association between prolonged loud noise exposure and hearing loss is well established. Long term exposure to high-speed handpieces and other noise intensive devices places dental practitioners at risk of developing noise-induced hearing loss and tinnitus. The sound intensities generated by dental instruments is well established. Hearing loss at speech frequencies has been reported for hygienists and dentists (Wilson, Darby et al. 2002) (Gijbels, Jacobs et al. 2006). The physiological effects of sound on hearing depends both on the exposure duration and sound intensity. Thus, prolonged use of these instruments may provoke short or long term negative physiological disturbance and hearing damage.

This study aims to investigate the hearing loss potential among dental practitioners. The specific aims are:

1. To determine the knowledge and concerns of dentists and dental students about noise-induced hearing loss in their professions
2. To determine the percentage of dental practitioners who use hearing protection devices in the workplace

Dental Practitioners should evaluate the intensity of noises they are exposed to in the workplace. Hearing protective strategies including hearing protection devices should be implemented as needed.

Please spare us a few minutes to fill up a survey here: <http://bit.ly/1WwzgXI>
